Dashboard Design

1 Purpose of the Project

We need to create a Decathlon Sales & Customer Analytics Dashboard to consolidate raw, order-level transaction data into a single, self-service reporting view. This dashboard will help business stakeholders — regional managers, merchandising, and marketing teams — monitor revenue performance, customer behaviour, and product trends, and make faster, data-driven decisions without relying on any external BI tool.

2 Project Workflow / Steps

- 1 Prepare Raw Data** — Import and structure the 30,000-row raw Decathlon sales dataset as a formatted Excel Table for reliable, dynamic referencing.
- 2 Data Structuring** — Organise fields into logical groups — Order, Customer, Product, Store/Channel, and Time — so PivotTables can summarise cleanly across each dimension.
- 3 Pivot Table Analysis** — Build PivotTables to summarise Total Sales, Orders, Customers, and AOV across Year, Month, Product Category, Gender, and Sports Type.
- 4 Metric Calculations** — Create formulas for Year-on-Year (YoY) Growth, Average Order Value (AOV), and Customer Retention Rate.
- 5 Dashboard Creation** — Assemble KPI cards, charts, and slicers into one interactive dashboard sheet.

3 KPI's Requirement

Supporting KPIs also tracked on the dashboard: Total Orders, Total Customers, and Year-on-Year (YoY) Growth % for Sales, Orders, Customers, and AOV.

4 Charts to Create

- **Sales Over Time** — Track monthly revenue trend across the year.
- **Sales by Product Category** — Breakdown of revenue share across product categories.
- **Customer Retention Rate** — Trend of retention % month over month.
- **Sales by Gender** — Male vs. Female contribution to total revenue.
- **Top 5 Sports Types** — Ranked by sales value and order volume.

5 Interactivity Requirement

Year Slicer (2024 / 2025 / 2026) and Month buttons must be connected to every PivotTable so that all KPI cards and charts on the dashboard update dynamically based on the user's selection — enabling true self-service, drill-down analysis without editing any formula.

6 Formulas

EXCEL FORMULA FOR YEAR-ON-YEAR (YOY) GROWTH

```
= (This_Year_Sales - Last_Year_Sales) / Last_Year_Sales
```

EXCEL FORMULA FOR AVERAGE ORDER VALUE (AOV)

```
= Total_Sales / Total_Orders
```

EXCEL FORMULA FOR CUSTOMER RETENTION RATE

```
= Repeat_Customers / Total_Customers
```

7 Final Dashboard (Expected Output)

The final deliverable is a single, interactive dashboard sheet in Excel featuring KPI cards, year/month slicers, and visual breakdowns of sales trend, product category split, customer retention, gender-wise sales, and top sports categories.
